METHOD AND SYSTEM FOR SEGMENT REGISTRATION

Abstract of the Disclosure

A method and a system for segment registration use servers and clients on the Internet. The server includes a plurality of registration web pages and a registration file. The registration file includes a plurality of registration conditions and each condition corresponds to a registration request. After the client downloads the registration file, it initiates registration by continuously sending instructions via a browser interface. Based on the registration file downloaded from the server, the client then decides whether the instruction sent satisfies its corresponding condition and proceeds to the next step, sending a corresponding registration request to the server. Upon receiving the registration request, provided the registration request is complete, the execution of the instruction continues. If not, the server sends a registration web page responding to the registration request to the client. Only after the registration conditions are met in full can the instruction be continued.
